Dear Hiring Manager,

I am excited to apply for a software engineering opportunity. I have experience building and contributing to production software across backend services, distributed systems, databases, cloud infrastructure, AI-powered applications, and developer tooling.

At Yugabyte, I have worked extensively on Meko, an AI agentic-memory and knowledge-base platform, contributing across Go, Python, React, AWS, and MCP. I built the Meko web application and knowledge-base upload pipeline, including presigned S3 uploads with storage-level file-size and type validation. I also worked on knowledge-base ingestion, content deduplication, live upload status, and UUID-based APIs, helping make the platform more reliable and scalable.

I have also built features for authentication and AI observability. I implemented Google, LinkedIn, and GitHub sign-in through AWS Cognito, including federated identity linking and profile completion. For Meko's AI workflows, I developed decision tracing and retrieval observability so individual retrieval hits, queries, memories, and knowledge-base sources used in an AI response can be inspected. I also contributed to the Meko MCP server, enabling AI agents to interact with knowledge-base operations.

Beyond Meko, I have contributed to YugabyteDB and open-source projects including LangChain4j, yb-voyager, and node-postgres. My work includes YugabyteDB embedding-store integration, a distributed RAG retriever, database migration tooling, smart-driver work, CI infrastructure, observability, and developer-facing documentation. These contributions have given me experience working across large production codebases and collaborating on software used beyond my immediate team.

I am particularly interested in engineering work at the intersection of cloud, AI, and collaboration at scale. I would welcome the opportunity to bring my experience in backend engineering, distributed systems, cloud infrastructure, and AI-powered applications to your team and contribute to reliable, impactful software.

Best regards,
Krishna Tripathi
